

**2-HYDROXYMETHYLCYCLOPROPYLIDENEMETHYLPURINES  
AND -PYRIMIDINES AS ANTIVIRAL AGENTS**

**RELATED APPLICATIONS**

*Amen.*  
*a<sup>1</sup>* →

The present invention is a continuation-in-part of PCT International Application  
5 No. PCT/US98/00440, filed January 7, 1998, designating the United States, which  
claims priority from U.S. Serial No. 60/035,826, filed January 8, 1997 and U.S. Serial  
No. 60/045,676, filed May 6, 1997, all of which are hereby expressly incorporated by  
reference.

**SPONSORSHIP**

10 Work on this invention was supported in part by the National Cancer Institute,  
Grant No. RO1 CA32779 and National Institute Of Allergy And Infectious Diseases,  
Grant Nos. U19 A131718 and RO1 AI33332. The Government has certain rights in  
the invention.

**FIELD OF THE INVENTION**

15 The present invention relates generally to novel purine and pyrimidine  
compounds which have antiviral activity and methods of making and using same.

**BACKGROUND OF THE INVENTION**

Viruses are the etiologic cause of many life-threatening human diseases. Of  
special importance are herpes viruses such as herpes simplex 1 (HSV-1), herpes  
20 simplex 2 (HSV-2), cytomegalovirus (CMV), Epstein-Barr virus (EBV), varicella zoster  
virus (VZV) and human herpes virus 6 (HHV 6) which are associated with many  
common viral illnesses. The HSV-1 and HSV-2 infections are characterized by cold  
sores of skin, mouth or genital region. After primary infection the virus is harbored in  
neural cells and can reappear later in the life of a patient. Human CMV (HCMV)  
25 infection is a life-long affliction which can result in morbidity and mortality. These  
pathologies include microcephaly, hepatosplenomegaly, jaundice, encephalitis,  
infections of the newborn infants or fetuses in utero, and infections of  
immunocompromised hosts. The HCMV infection is responsible for retinitis, gastritis  
and pneumonitis in AIDS patients and HCMV-induced pneumonias or hepatitis are  
30 frequent and serious complications of bone marrow transplants. EBV causes  
infectious mononucleosis and it is considered as the etiologic agent of  
nasopharyngeal cancer, immunoblastic lymphoma, Burkitt's lymphoma and hairy  
leukoplakia. VZV causes chicken pox and shingles. Although in children the chicken  
pox is usually a non-fatal disease, the recurrent form of this infection, shingles, may  
35 in advanced stage lead to paralysis, convulsions and ultimately death. Again, in

immunocompromised patients the infection with VZV is a serious complication. Human herpes virus 6 (HHV-6) which is commonly associated with children's rash was also identified in acquired immunodeficiency syndrome (AIDS) patients and it may be a cofactor in the pathogenesis of AIDS in hosts infected with human immunodeficiency virus (HIV). Levine, A.J., Viruses, Ch. 4, W. H. Freeman & Co., New York, pp. 67-85 (1992); Human Herpesvirus Infections, Raven Press, New York (1986).

HIV is the underlying cause of AIDS, a world-wide epidemic with fatal consequences. According to the World Health Organization, over 4.5 million AIDS cases were recorded by late 1994 and 19.5 million people had been infected with HIV. It is estimated that by the year 2000, 30 to 40 million will have been infected with HIV with 10 million cases of full-blown AIDS. Estimates of Global AIDS Policy Coalition are considerably higher - up to 110 million HIV infections and 25 million AIDS cases. The Relationship between the Human Immunodeficiency Virus and the Acquired Immunodeficiency Syndrome, The National Institute of Allergy and Infectious Diseases, National Institutes of Health, Bethesda, Maryland, pp. 1-3 (1995).

Various alkyl derivatives of purines and pyrimidines and analogues thereof have been found to exhibit antiviral activity. Notably, acyclovir (Zovirax) and ganciclovir (Cytovene) belonging to this group of compounds are approved drugs for infections caused by HSV-1, HSV-2, VZV and HCMV. Acyclovir Therapy for Herpesvirus Infections (Baker, Ed.), M. Dekker, New York, (1990); Ganciclovir Therapy for Cytomegalovirus Infection (Spector, S. S., Ed.), M. Dekker, New York (1991). A considerable effort went into design, synthesis and biological investigation of analogues of these drugs as well as in development of new antiviral agents. Larsson, A., et al., *Antimicrob. Agents & Chemother.* 30:598-605 (1986); Ashton, W.T., et al., *J. Med. Chem.* 31:2304-2315 (1988).

Current drugs for AIDS include AZT (zidovudine, Retrovir), ddI (didanosine, Videx), ddC (zalcitabine, Hivid) and d4T (stavudine, Zerit). De Clercq, E., *J. Med. Chem.* 38:2491-2517 (1995). Allenic nucleoside analogues such as adenallene and cytallene are examples of anti-HIV agents containing an unsaturated alkyl group. U.S. Patent No. 4,935,427; Zemlicka, J., Allenols Derived from Nucleic Acid Bases - a New Class of Anti-HIV Agents: Chemistry and Biological Activity in Nucleosides and Nucleotides as Antitumor and Antiviral Agents (Chu, C. K.; Baker, D. C., Eds.), Plenum Press, New York, pp. 73-100 (1993).

It would thus be desirable to provide novel compounds which are active against viruses, including HCMV, HSV-1, HSV-2, HHV-6, HIV, hepatitis B virus (HBV), and other mammalian viruses.

### SUMMARY OF THE INVENTION

- 5 The present invention provides novel 2-hydroxymethylcyclopropyldenemethyl-derivatives of heterocyclic compounds, prodrugs and pharmacologically acceptable acid salts thereof. These compounds have been found to be useful antiviral agents and are effective against HCMV, HSV-1, HSV-2, HHV-6, HIV, EBV and HBV, as well as against other mammalian viruses.
- 10 The compounds of the present invention have the following Formulas:

Formula 1

Formula 2

wherein

- B is a heterocyclic ring derived from a purine or pyrimidine moiety. In a preferred embodiment, the purine moieties include 6-aminopurine (adenine), 2,6-diaminopurine, 2-amino-6-azidopurine, 2-amino-6-thiopurine, 2-amino-6-alkylaminopurines such as 2-amino-6-cyclopropylaminopurine, 6-hydroxypurine (hypoxanthine), 2-amino-6-halo substituted purines, such as 2-amino-6-chloropurine, 2-amino-6-alkoxy substituted purines, such as 2-amino-6-methoxypurine, 2-amino-6-hydroxypurine (guanine), 3-deazapurines, 7-deazapurines, 8-azapurines, cytosine, 5-halo substituted cytosines, 5-alkyl substituted cytosines, thymine, uracil and 6-azapyrimidines.
- 15
- 20

- Prodrugs of the antiviral nucleoside analogues of the present invention include lipophilic phosphate esters or amidates capable of penetrating the cell membrane. Those skilled in the art will appreciate that the aim of prodrugs is to provide effective therapeutic agents for resistant strains of viruses (McGuigan, C., et al., *J. Med. Chem.* 36:1048-1052 (1993)) or activate inactive analogues. Franchetti, P., et al., *J. Med. Chem.* 37:3534-3541 (1994).
- 25

The compounds of the present invention therefore also include prodrugs of the novel compounds, wherein the prodrugs have the following Formulas:

Formula 3

Formula 4

wherein

B is a heterocyclic ring as defined above for Formulas 1 and 2;

5 X is O; and

R<sub>1</sub> and R<sub>2</sub> are alkyl or aryl. The R<sub>1</sub>X or R<sub>2</sub>X may also be amino acid residues with X as NH.

Compositions useful for treating viral infections, such as HCMV, HSV-1, HSV-2, HHV-6, HIV, EBV and HBV contain an effective amount of at least one compound of Formulas 1 to 4 or a pharmaceutically acceptable salt thereof.

The present invention also includes methods for synthesizing compounds of Formulas 1 and 2 wherein B is a heterocyclic ring derived from purine or pyrimidine moiety such as 6-aminopurine (adenine), 2,6-diaminopurine, 2-amino-6-azidopurine, 2-amino-6-thiopurine, 2-amino-6-alkylaminopurines such as 2-amino-6-cyclopropylaminopurine, 6-hydroxypurine (hypoxanthine), 2-amino-6-halo substituted purines, such as 2-amino-6-chloropurine, 2-amino-6-alkoxy substituted purines, such as 2-amino-6-methoxypurine, 2-amino-6-hydroxypurine (guanine), 3- and 7-deazapurines, such as 3- and 7-deazaadenine, 8-azapurines such as 8-azaadenine, cytosine, 5-halocytosine (wherein halo is bromo, chloro, iodo or fluoro) and related alkyl derivatives containing a saturated or unsaturated alkyl group at the 5-position, thymine, uracil, 6-azapyrimidines such as 6-azacytosine, wherein the alkyl side-chain attached to the heterocyclic ring is a 2-hydroxymethylcyclopropylidenemethane moiety.

The present invention also provides methods for synthesizing prodrugs of the compounds as set forth in Formulas 3 and 4.

The present invention also provides methods for synthesizing essentially enantiomerically pure *R*- and *S*-enantiomers of the compounds of the present invention.

Additional objects, advantages, and features of the present invention will become apparent from the following description, taken in conjunction with the accompanying drawings.

### BRIEF DESCRIPTION OF THE DRAWINGS

5           The various advantages of the present invention will become apparent to one skilled in the art by reading the following specification and by referencing the following drawings in which:

          Figure 1 shows the synthesis of the mixture of *cis*-ethyl 2-bromo-2-bromomethylcyclopropane 1-carboxylate (6) and *trans*-ethyl 2-bromo-2-bromomethylcyclopropane 1-carboxylate (7);

          Figure 2 shows the synthesis of purine and pyrimidine 2-hydroxymethylcyclopropylidenemethylpurines and -pyrimidines of Formulas 1 and 2;

          Figure 3 shows the method for separation of *syn*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (1, B = adenin-N<sup>9</sup>-yl) and *anti*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (2, B = adenin-N<sup>9</sup>-yl);

          Figure 4 shows the hydrolysis of *syn*-2-amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine (1, B = 2-amino-6-chloropurine) and *anti*-2-amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine (1, B = 2-amino-6-chloropurine) to *syn*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)guanine (1, B = guanine) and *anti*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)guanine (1, B = guanine). Figure 4 also shows the synthesis of *syn*-2,6-diamino-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine (1, B = 2,6-diaminopurine) and *syn*-2-amino-6-cyclopropylamino-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine (1, B = 2-amino-6-cyclopropylaminopurine) from *syn*-2-amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine (1, B = 2-amino-6-chloro- purine);

          Figure 5 shows the method for separation of *syn*-N<sup>1</sup>-(2-hydroxymethylcyclopropylidenemethyl)cytosine (1, B = cytosin-N<sup>1</sup>-yl) and *trans*-N<sup>1</sup>-(2-hydroxymethylcyclopropylidenemethyl)cytosine (2, B = cytosin-N<sup>1</sup>-yl);

          Figure 6 shows the synthesis of methyl phenylphosphoro-L-alaninate of *syn*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (3, B = adenin-N<sup>9</sup>-yl); and

          Figure 7 shows the synthesis of methyl phenylphosphoro-L-alaninate of *anti*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (4, B = adenin-N<sup>9</sup>-yl).

### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

          The compounds of the present invention which have been found to be effective against herpes viruses, human immunodeficiency virus, and hepatitis B virus, are

compounds of Formulas 1 to 4, wherein B represents a heterocyclic ring derived from purine or pyrimidine moiety such as 6-aminopurine (adenine), 2,6-diaminopurine, 2-amino-6-azidopurine, 2-amino-6-thiopurine, 2-amino-6-alkylaminopurines such as 2-amino-6-cyclopropylaminopurine, 6-hydroxypurine (hypoxanthine), 2-amino-6-halo substituted purines, such as 2-amino-6-chloropurine, 2-amino-6-alkoxy substituted purines, such as 2-amino-6-methoxypurine, 2-amino-6-hydroxypurine (guanine), 3- and 7-deazapurines, such as 3- and 7-deazaadenine, 8-azapurines such as 8-azaadenine, cytosine, 5-halocytosine (wherein halo is bromo, chloro, iodo, or fluoro) and related alkyl derivatives containing a saturated or unsaturated alkyl group at the 5-position, thymine, uracil or 6-azapyrimidine, wherein the alkyl side-chain attached to the heterocyclic ring is a 2-hydroxymethylcyclopropylidenemethane moiety. The R<sub>1</sub>, R<sub>2</sub> in Formulas 3 and 4 are alkyl or aryl groups, X is O and R<sub>1</sub>X and R<sub>2</sub>X can also be amino acid residues with X as NH.

The preferred compounds of the present invention are *syn*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (synadenol), wherein in Formula 1, B is adenin-N<sup>9</sup>-yl, *syn*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)guanine (synguanol), wherein B is guanin-N<sup>9</sup>-yl, *syn*-N<sup>1</sup>-(2-hydroxymethylcyclopropylidenemethyl)cytosine (syncytol) wherein in Formula 1, B is cytosin-N<sup>1</sup>-yl, *syn*-2,6-diamino-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine wherein in Formula 1, B is 2,6-diaminopurine; *syn*-2-amino-6-cyclopropylamino-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine wherein in Formula 1, B is 2-amino-6-cyclopropylaminopurin-N<sup>9</sup>-yl, *syn*-2-amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine wherein in Formula 1, B is 2-amino-6-chloropurin-N<sup>9</sup>-yl, *syn*-2-amino-6-methoxy-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine wherein in Formula 1, B is 2-amino-6-methoxypurin-N<sup>9</sup>-yl and *syn*-2-amino-6-azido-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine wherein in Formula 1, B is 2-amino-6-azidopurin-N<sup>9</sup>-yl.

The preferred compounds of the present invention are also methyl phenyl-phosphoro-L-alaninate of *syn*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (3, B=adenin-N<sup>9</sup>-yl) and *anti*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (4, B is adenin-N<sup>9</sup>-yl).

The nomenclature of the compounds of the present invention follows standard conventions. The numbering of the cyclopropylidenemethane moiety attached to the

heterocyclic ring B is shown in Formulas 1 and 2. The purine and pyrimidine rings are numbered as indicated below:

It is appreciated that heterocyclic rings containing hydroxy and amino groups are tautomeric with the corresponding oxo and imino compounds.

- 5 Preferred compounds of the present invention also include the *R*- and *S*-enantiomers of the compounds of Formulas 1 through 4. The compounds described by Formulas 1 through 4 contain an asymmetric carbon atom marked in the Formulas 1 and 2 by an asterisk. Compounds of Formula 1 and 2 of the present invention are therefore racemic mixtures of two optical antipodes which may be resolved by
- 10 conventional methods such as chromatography or fractional crystallization of suitable diastereoisomeric derivatives such as salts or esters with optically active acids (camphor 10-sulfonic acid, methoxyacetic acid, dibenzoyltartaric acid, 6-methoxy-2-naphthyl-2-propanoic acid, etc.), by an enantioselective enzymic synthesis of esters of one antipode such as acetates or butyrates or by an enantioselective enzymic
- 15 hydrolysis of esters of compounds of Formulas 1 and 2 such as acetates or butyrates. The suitable enzymes include, but are not limited to, lipases such as lipase AK, lipase P30 or esterases such as pig liver esterase. Racemic compounds containing adenine moiety may also be resolved by the action of adenosine deaminase. Alternatively, the *R*- and *S*-enantiomers can be obtained by synthetic methods utilizing enantiomerically
- 20 pure starting materials as described in Examples 20 through 25.

Compounds 3 and 4 derived from racemic analogues 1 and 2 are mixtures of four diastereoisomers provided that  $R_1X$  is not the same as  $R_2X$ .

- The syntheses of compounds of the present invention are summarized in Figures 1 to 7. Generally, alkyl *cis*- and *trans*-2-halo-2-halomethylcyclopropane 1-
- 25 carboxylates can be used as suitable alkylating agents. Ethyl *cis*- and *trans*-2-chloro-2-chloromethylcyclopropane 1-carboxylates were previously described. Dyakonov, I.A., et al., *J. Gen. Chem. USSR* (English translation) 25:1435-1440 (1955). More reactive *cis*- and *trans*-2-bromo-2-bromomethylcyclopropane-1-carboxylates 6 and 7, which are the preferred reagents, were prepared as follows: addition of ethyl

diazoacetate to 2,3-dibromopropene (5) in the presence of suitable catalyst, e.g., dirhodium tetraacetate (Doyle, M.P., et al., *J. Org. Chem.* 46:5094-5102 (1981)) and organic solvent such as dichloromethane, afforded a mixture (1.5 : 1) of ethyl *cis*- and *trans*-2-bromo-2-bromomethylcyclopropane 1-carboxylates (6 and 7) as described in Figure 1. The resultant mixture is then used for alkylation of heterocycles B-H (8, B = purine or pyrimidine moiety) in the presence of an appropriate base, e.g., potassium carbonate or sodium hydride in an organic solvent, e.g., N,N-dimethylformamide, to give a mixture of *cis*- and *trans*-1-bromo-2-(carbethoxy)cyclopropylmethylpurines or -pyrimidines 9 and 10 in the ratio of 1.5 : 1 as described in Figure 2.

A mixture of bromoesters 9 and 10 was converted to a mixture of *syn*- and *anti*-2-carbethoxycyclopropylidenemethylpurines or -pyrimidines 11 and 12 ( $R = C_2H_5$ ) using a strong base, e.g., potassium tert.-butoxide in an appropriate solvent such as N,N-dimethylformamide as shown in Figure 2.

Alternately, the alkylation and elimination can be combined into a single step. Thus, the reaction of heterocycle B-H (8, B = purine or pyrimidine moiety) with ethyl 2-bromo-2-bromomethylcyclopropane-1-carboxylates (6 and 7) is performed with potassium carbonate in N,N-dimethylformamide at an elevated temperature to give directly a mixture of the desired *syn*- and *anti*-2-carbethoxycyclopropylidenemethylpurines or -pyrimidines 11 and 12 ( $R = C_2H_5$ ) as shown in Figure 2. A work up of the reaction mixture with methanol leads to transesterification to give methyl esters 11 and 12 ( $R = CH_3$ ).

The reduction of carboethoxy or carbomethoxy group with a suitable reducing agent, e.g., diisobutylaluminum hydride and organic solvent such as tetrahydrofuran affords the compounds of the present invention, *syn*- and *anti*-2-hydroxymethylcyclopropylidenemethylpurines or -pyrimidines 1 and 2, as described in Figure 2. A mixture of compounds 1 and 2 is then separated by crystallization or chromatography on silica gel either directly or after a suitable derivatization.

For example, a mixture of *syn*- and *anti*-N<sup>6</sup>-(2-hydroxymethylcyclopropylidene-methyl)adenines 1 and 2 (B = adenin-N<sup>9</sup>-yl) is converted to the corresponding N<sup>6</sup>-dimethylaminomethylene derivatives 1 and 2 (B = N<sup>6</sup>-dimethylaminomethylene-adenin-N<sup>9</sup>-yl) by reaction with N,N-dimethylformamide dimethyl acetal (Zemlicka, J., et al., *Collect. Czech. Chem. Commun.* 32:3159-3168 (1967)), in a suitable solvent such as N,N-dimethylformamide as described in Figure 3. Compounds 1 and 2 (B = N<sup>6</sup>-dimethylaminomethyleneadenin-N<sup>9</sup>-yl) are then separated by chromatography on silica

gel and each isomer is deprotected with ammonia in methanol to give compounds of the present invention, synadenol (1, B = adenin-N<sup>9</sup>-yl) and *anti* isomer 2 (B = adenin-N<sup>9</sup>-yl).

*Syn*- and *anti*-2-amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)-  
5 purine 1 and 2 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl) are separated by column chromatography on silica gel. The *syn* and *anti* isomers 1 and 2 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl) are hydrolyzed with 80% formic acid (Harnden, M.R., et al., *J. Med. Chem.* 33:187-196 (1990)), to give compounds of the present invention, synguanol (1, B = guanin-N<sup>9</sup>-yl) and *anti* isomer 2 (B = guanin-N<sup>9</sup>-yl), as described in Figure 4.

10 Ammonolysis of the *syn*-2-amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine 1 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl) affords *syn*-2,6-diamino-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine 1 (B = 2,6-diaminopurin-N<sup>9</sup>-yl) as shown in Figure 4.

Reaction of *syn*-2-amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine 1 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl) with cyclopropylamine gives *syn*-2-amino-6-cyclopropylamino-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine 1 (B = 2-amino-6-cyclopropylaminopurin-N<sup>9</sup>-yl) as shown in Figure 4.

The mixture of *syn*- and *anti*-N<sup>1</sup>-(2-hydroxymethylcyclopropylidenemethyl)-cytosines 1 and 2 (B = cytosin-N<sup>1</sup>-yl) is benzoylated with a suitable benzoylating agent  
20 such as benzoic anhydride in an appropriate solvent such as ethanol (Otter, B.A., et al., N-Acyl Derivatives of 2'-Deoxycytidine in Synthetic Procedures in Nucleic Acid Chemistry, Vol. 1, John Wiley & Sons, New York, pp. 285-287 (1967)) to give *syn*- and *anti*-(N<sup>4</sup>-benzoyl)-N<sup>1</sup>-(2-hydroxymethylcyclopropylidenemethyl)cytosines 1 and 2 (B = N<sup>4</sup>-benzoylcytosin-N<sup>1</sup>-yl) which are separated by chromatography on silica gel as  
25 described in Figure 5. The separated isomers are debenzoylated with ammonia in methanol to afford *syn*- and *anti*-N<sup>1</sup>-(2-hydroxymethylcyclopropylidenemethyl)cytosine 1 and 2 (B = cytosin-N<sup>1</sup>-yl).

Prodrugs of *syn*- and *anti*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)-adenines 3 and 4 (B = adenin-N<sup>9</sup>-yl) were prepared by reaction of 1 and 2 (B = adenin-N<sup>9</sup>-yl) with phenylmethoxyalaninylphosphorochloridate (13) (McGuigan, C., et al., *Antiviral Res.* 17:311-321 (1992)) using a suitable catalyst, e.g., N-methylimidazole, in an appropriate organic solvent such as tetrahydrofuran and pyridine as described in Figures 6 and 7.

The *R*- and *S*-enantiomers of the compounds of Formulas 1 through 4 can be  
35 synthesized utilizing (*R*)- and (*S*)-methylenecyclopropanecarboxylic acids.

Compositions within the scope of invention include those comprising a novel compound of the present invention in an effective amount to achieve an intended purpose. Determination of an effective amount and intended purpose is within the skill of the art. Preferred dosages, which are dependent for example, on the severity of the infection and the individual patient's response to the treatment, can range from about 0.01 to about 100 mg/kg of body weight to give a blood concentration ranging from about 0.05  $\mu$ g to about 5 mg per mL of whole blood.

As used herein, the term "pharmaceutically acceptable salts" is intended to mean salts of the compounds of the present invention with pharmaceutically acceptable acids, e.g., inorganic acids such as sulfuric, hydrochloric, phosphoric, etc. or organic acids such as acetic.

Pharmaceutically acceptable compositions of the present invention may also include suitable carriers comprising excipients and auxiliaries which facilitate processing of the active compounds into preparations which may be used pharmaceutically. Such preparations, preferably those which can be administered orally, include tablets, dragees and capsules. Further preferred preparations are those which can be administered rectally, such as suppositories, as well as suitable solutions for administration by injection or orally, contain from about 0.1 to about 99%, preferably about 25 to about 85%, of the active compound of the present invention, together with the excipient.

The pharmaceutical preparations of the present invention are manufactured in a manner which is itself known, e.g., using the conventional mixing, granulating, dragee-making, dissolving or lyophilizing processes. Thus, pharmaceutical preparations for oral use can be obtained by combining the active compounds with solid excipients, optionally grinding a resulting mixture and processing the mixture of granules, after adding suitable auxiliaries, if desired or necessary, to obtain tablets or dragee cores.

Suitable excipients are, in particular, fillers such as sugars, e.g., lactose or sucrose, mannitol or sorbitol, cellulose preparations and/or calcium phosphates, e.g., tricalcium diphosphate or calcium hydrogen phosphate, as well as binders such as starch paste, using, e.g., maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose and/or polyvinylpyrrolidone. If desired, disintegrating agents may be added such as the above-mentioned starches and also carboxymethyl starch, cross-linked polyvinylpyrrolidone, agar, or alginic acid or a salt thereof, such as sodium alginate. Auxiliaries are, above all, flow-regulating agents and

lubricants, e.g., silica, talc, stearic acid or salts thereof, such as magnesium stearate or calcium stearate, and/or polyethylene glycol. Dragee cores are provided with suitable coatings which, if desired, are resistant to gastric juices. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinylpyrrolidone, polyethylene glycol and/or titanium dioxide, lacquer solutions and suitable organic solvent or solvent mixtures. In order to produce coatings resistant to gastric juices, solutions of suitable cellulose preparations, such as acetylcellulose phthalate or hydroxypropylmethylcellulose phthalate, are used. Dyestuffs or pigments may be added to the tablets or dragee coatings, e.g., for identification or in order to characterize different combinations of active compound doses.

Other pharmaceutical preparations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer such as glycerol or sorbitol. The push-fit capsules may contain the active compounds in the form of granules which may be mixed with fillers such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds are preferably dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. In addition, stabilizers may be used.

Possible pharmaceutical preparations which can be used rectally include, e.g., suppositories, which consist of a combination of the active compounds with a suppository base. Suitable suppository bases are, e.g., natural or synthetic triglycerides, paraffin hydrocarbons, polyethylene glycols or higher alkanols. It is also possible to use gelatin rectal capsules which consist of a combination of the active compounds with a base. Possible base materials include, e.g., liquid triglycerides, polyethylene glycols or paraffin hydrocarbons.

Suitable formulations for parenteral administration include aqueous solutions of the active compounds in water-soluble form, e.g., water-soluble salts. In addition, suspension of the active compounds as appropriate oily injection suspensions may be administered. Suitable lipophilic solvents or vehicles include fatty oils, such as sesame oil, or synthetic fatty acid esters, e.g., ethyl oleate or triglycerides. Aqueous injection suspensions may contain substances which increase the viscosity of the suspension such as sodium carboxymethylcellulose, sorbitol and/or dextran. Optionally, the suspension may also contain stabilizers.

Alternatively, the active compounds of the present invention may be administered in the form of liposomes, pharmaceutical compositions wherein the

active compound is contained either dispersed or variously present in corpuscles consisting of aqueous concentrate layers adherent to hydrophobic lipidic layer. The active compound may be present both in the aqueous layer and in the lipidic layer or in the non-homogeneous system generally known as a lipophilic suspension.

- 5           It will be appreciated that the active compounds of the present invention may be administered in combination with known antiviral agents, e.g., acyclovir, ganciclovir, zidovudine, AZT, ddl, ddC, 3TC and d4T.

The following Examples further describe the compounds of the present invention and the synthesis schemes for producing same.

10   **EXAMPLE 1 -           Synthesis of *cis* and *trans* Ethyl 2-Bromo-2-bromomethylcyclopropane-1-carboxylates (6 and 7).**

Ethyl diazoacetate (90% in dichloromethane, 23.3 mL, 0.20 mol) was added into a solution of dirhodium tetraacetate (22.1 mg, 0.05 mmol) in 2,3-dibromopropene (5, 97%, 68.0 g, 0.34 mol) and  $\text{CH}_2\text{Cl}_2$  (3 mL) with the aid of a syringe pump at a rate  
15   of 1.1 mL/hour with stirring at room temperature. The reaction mixture was distilled in vacuo and the distillate was trapped at  $-78^\circ\text{C}$  to recover unreacted 2,3-dibromopropene (20 g, 29%). Water (100 mL) was added to the oily residue followed by a portionwise addition of powdered potassium permanganate at  $0^\circ\text{C}$  with stirring. A total of 30 g of permanganate was consumed. The excess of permanganate was  
20   removed by addition of solid sodium thiosulfate. The mixture was filtered using a Celite pad and the solids were washed with ether (4 x 80 mL) with the aid of a sonicator. The filtrate was extracted with ether (4 x 70 mL). The combined ether portions were washed with saturated aqueous sodium bicarbonate (2 x 100 mL), water (2 x 250 mL) and brine (2 x 100 mL). After drying with sodium sulfate and  
25   evaporation of ether a mixture of products 6 and 7 was obtained as a yellow oil (51.9 g, 91% yield),  $n_D^{25} = 1.5131$ . It was of sufficient purity to be used in the subsequent steps (Examples 2, 4, 6 and 10). The  $^1\text{H}$  NMR spectrum indicated a mixture of *cis* and *trans* isomers 6 and 7 in the ratio of 1.5 : 1. Distillation of a sample of this product (5.0 g) gave colorless liquid (4.5 g), bp.  $59-64^\circ\text{C}/0.25$  mmHg,  $n_D^{25} = 1.5139$ .

30           IR (neat):  $1733\text{ cm}^{-1}$  (C=O, ester),  $1036$  and  $868\text{ cm}^{-1}$  (cyclopropane ring).

$^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$ , *cis* isomer 1.30 (t, 3,  $\text{CH}_3$ ), 1.73 (t, 1) and 1.85 (dd, 1,  $\text{H}_3$ ), 2.47 (dd, 1,  $\text{H}_2$ ), 3.97 (d, 2,  $\text{CH}_2\text{Br}$ ), 4.19 (q, 2,  $\text{OCH}_2$ ); *trans* isomer 1.29 (t, 3,  $\text{CH}_3$ ), 1.52 (dd, 1) and 1.89 (t, 1,  $\text{H}_3$ ), 2.10 (dd, 1,  $\text{H}_2$ ), 3.76 (d, 2,  $\text{CH}_2\text{Br}$ ), 4.21 (q, 2,  $\text{OCH}_2$ ).

$^{13}\text{C}$  NMR ( $\text{CDCl}_3$ ) ppm, *cis* isomer 14.14 ( $\text{CH}_3$ ), 26.43 ( $\text{C}_3$ ), 31.44 ( $\text{C}_1$ ), 37.21 ( $\text{C}_2$ ), 38.91 ( $\text{CH}_2\text{Br}$ ), 61.66 ( $\text{OCH}_2$ ), 169.32 ( $\text{C}=\text{O}$ ); *trans* isomer 14.30 ( $\text{CH}_3$ ), 22.34 ( $\text{C}_3$ ), 29.01 ( $\text{C}_1$ ), 35.86 ( $\text{C}_2$ ), 42.02 ( $\text{CH}_2\text{Br}$ ), 61.59 ( $\text{OCH}_2$ ), 168.12 ( $\text{C}=\text{O}$ ).

5 EI-MS 288 (M, 0.3), 286 (M, 1.9) and 284 (M, 0.5), 256 (1.6), 258 (2.6) and 260 (1.2), 243 (5.0), 241 (10.2) and 239 (5.3), 211 (7.0), 213 (13.8) and 215 (7.4), 205 (52.2) and 207 (51.0), 177 (96.7) and 179 (94.4), 159 (7.1) and 161 (7.0), 131 (15.2) and 133 (16.8), 97 (30.4), 81 (15.3), 69 (16.3), 53 (70.8), 39 (15.9), 28 (CO, 100.0);

HRMS: Calculated for  $\text{C}_7\text{H}_{10}^{79}\text{Br}_2\text{O}_2$ : M 283.90475. Found: M 283.9048.

10 Calculated for  $\text{C}_7\text{H}_{10}\text{Br}_2\text{O}_2$ : C, 29.59; H, 3.55; Br, 55.59. Found: C, 29.61; H, 3.62; Br, 55.37.

**EXAMPLE 2 - Synthesis of *cis*-N<sup>9</sup>-(1-Bromo-2-carbethoxycyclopropylmethyl)adenine and *trans*-N<sup>9</sup>-(1-Bromo-2-carbethoxycyclopropylmethyl)adenine 9 and 10.**

15 A mixture of dibromoesters 6 and 7 (858 mg, 3.0 mmol) from Example 1 was added into a suspension of sodium salt of adenine which was prepared from adenine (405 mg, 3.0 mmol) and sodium hydride (60% dispersion in mineral oil, 120 mg, 3.0 mmol) in N,N-dimethylformamide (25 mL) with stirring under nitrogen at room temperature. The resultant mixture was heated to 80°C (bath temperature) for 12  
20 hours. The solvent was evaporated *in vacuo* (oil pump), the residue was adsorbed on silica gel (3 g) which was then put on the top of a silica gel (70 g) column. The elution was performed with dichloromethane - methanol (96 : 4 and 94 : 6) the *cis* isomer 9 (305 mg, 29.9% yield) and *trans* isomer 10 (180 mg, 17.6% yield) were obtained as pale yellow solids. Analytical samples were obtained by recrystallization from benzene  
25 - ethyl acetate (*cis* isomer 9) and benzene (*trans* isomer 10).

Cis isomer 9:

Mp. 200 - 203°C.

UV (ethanol) max 260 nm ( $\epsilon$  14,900), 209 nm ( $\epsilon$  19,500).

30 IR (KBr) 3340 and 3150  $\text{cm}^{-1}$  ( $\text{NH}_2$ ), 1725  $\text{cm}^{-1}$  ( $\text{C}=\text{O}$ , ester), 1670, 1600 and 1580  $\text{cm}^{-1}$  (adenine ring), 1045, 1015 and 867  $\text{cm}^{-1}$  (cyclopropane ring).

$^1\text{H}$  NMR ( $\text{CD}_3\text{SOCD}_3$ )  $\delta$  1.23 (t, 3,  $\text{CH}_3$ ), 1.76 (dd, 1) and 2.00 (t, 1,  $\text{H}_4$ ), 2.49 (dd, 1,  $\text{H}_3$  of cyclopropane), 4.18 (q, 2,  $\text{OCH}_2$ ), 4.66 (s, 2,  $\text{H}_1$ ), 7.24 (s, 2,  $\text{NH}_2$ ), 8.10 (s, 2,  $\text{H}_2$  and  $\text{H}_8$  of adenine).

$^{13}\text{C}$  NMR ( $\text{CD}_3\text{SOCD}_3$ ) ppm 13.52 ( $\text{CH}_3$ ), 22.25 ( $\text{C}_4$ ), 28.57 ( $\text{C}_3'$ ), 36.28 ( $\text{C}_2$ ), 46.64 ( $\text{C}_1$ ), 60.75 ( $\text{OCH}_2$ ), 168.82 ( $\text{C}=\text{O}$ ); adenine ring: 118.10 ( $\text{C}_5$ ), 140.46 ( $\text{C}_8$ ), 149.20 ( $\text{C}_4$ ), 152.03 ( $\text{C}_2$ ), 155.49 ( $\text{C}_6$ ).

5 FAB-MS (thioglycerol matrix) 341 and 343 ( $\text{M}+2\text{H}$ , 20.3, 18.6), 340 and 342 ( $\text{M} + \text{H}$ , 98.4, 100.0), 262 (8.0), 214 (4.3), 188 (5.9), 136 (25.2).

Calculated for  $\text{C}_{12}\text{H}_{14}\text{BrN}_5\text{O}_2$ : C, 42.47; H, 4.16; Br, 23.28; N, 20.65. Found: C, 42.24; H, 4.29; Br, 23.15; N, 20.59.

*Trans* isomer 10:

Mp. 186 - 189°C.

10 UV (ethanol) max 260 nm ( $\epsilon$  14,700), 209 nm ( $\epsilon$  18,700).

IR (KBr) 3350 and 3160  $\text{cm}^{-1}$  ( $\text{NH}_2$ ), 1745  $\text{cm}^{-1}$  ( $\text{C}=\text{O}$ , ester), 1655, 1605 and 1585  $\text{cm}^{-1}$  (adenine ring), 1045, 1015 and 865  $\text{cm}^{-1}$  (cyclopropane ring).

$^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.14 (t, 3,  $\text{CH}_3$ ), 1.57 (t, 1) and 1.93 (dd, 1,  $\text{H}_4$ ), 2.64 (dd, 1,  $\text{H}_3$ ), 4.07 (q, 2,  $\text{OCH}_2$ ), 4.52 (d, 2,  $\text{H}_1$ ), 7.27 (s, 2,  $\text{NH}_2$ ), 8.13 and 8.17 (2s, 2,  $\text{H}_2$  and  $\text{H}_6$  of adenine).

15  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ ) ppm 13.70 ( $\text{CH}_3$ ), 19.95 ( $\text{C}_4$ ), 26.05 ( $\text{C}_3$ ), 36.99 ( $\text{C}_2$ ), 51.93 ( $\text{C}_1$ ), 60.42 ( $\text{OCH}_2$ ), 167.63 ( $\text{C}=\text{O}$ ); adenine ring: 118.01 ( $\text{C}_5$ ), 140.30 ( $\text{C}_8$ ), 149.23 ( $\text{C}_4$ ), 152.14 ( $\text{C}_2$ ), 155.55 ( $\text{C}_6$ ).

20 FAB-MS (thioglycerol matrix) 341 and 343 ( $\text{M} + 2\text{H}$ , 19.0, 18.2), 340 and 342 ( $\text{M} + \text{H}$ , 96.3, 100.0), 262 (32.1), 214 (12.1), 188 (12.5), 136 (78.3).

Calculated for  $\text{C}_{12}\text{H}_{14}\text{BrN}_5\text{O}_2$ : C, 42.47; H, 4.16; Br, 23.28; N, 20.65. Found: C, 42.60; H, 4.34; Br, 23.14; N, 20.87.

25 **EXAMPLE 3 - Synthesis of syn -  $\text{N}^9$  - (2 - Carbethoxycyclopropylidenemethyl)adenine (11, B = adenine- $\text{N}^9$ -yl, R = ethyl) and anti- $\text{N}^9$ -(2-Carbethoxycyclopropylidenemethyl)adenine (12, B = adenine- $\text{N}^9$ -yl, R = ethyl) Using Bromoesters 9 and 10 as Starting Materials.**

30 Solid potassium tert.-butoxide (505 mg, 4.5 mmol) was added into a solution of bromoesters 9 and 10 from Example 2 (1.02 g, 1.023 mmol) in DMF (35 mL) at 0°C with stirring under nitrogen. The stirring continued for 2 hours. The reaction mixture was then added dropwise into saturated aqueous ammonium chloride (20 mL) at 0°C with stirring. After 15 minutes, the solvents were removed by evaporation *in vacuo* at room temperature. The residue was chromatographed on a silica gel column using dichloromethane - methanol (9 : 1) as an eluent to give the mixture of  
35 compounds 11 and 12 (B = adenine- $\text{N}^9$ -yl, R = ethyl, 545 mg, 70% yield) as a white powder. Mp. 166 - 175°C after recrystallization from benzene. The  $^1\text{H}$  NMR indicated

the presence of *syn* and *anti* isomers 10 and 11 (B = adenin-N<sup>9</sup>-yl, R = ethyl) in the ratio of 1.5 : 1.

UV (ethanol) max 276 nm (shoulder,  $\epsilon$  7,600), 256 nm (shoulder,  $\epsilon$  11,800), 228 nm ( $\epsilon$  22,500).

5 IR (KBr) 3350 and 3160 cm<sup>-1</sup> (NH<sub>2</sub>), 1735 cm<sup>-1</sup> (C=O, ester), 1660, 1605 and 1585 cm<sup>-1</sup> (adenine ring and olefin).

<sup>1</sup>H NMR (CD<sub>3</sub>SOCD<sub>3</sub>)  $\delta$ , *syn* isomer 11 (B = adenine-N<sup>9</sup>-yl, R = ethyl) 1.13 (t, 3, CH<sub>3</sub>), 1.91 (ddd, 1) and 2.00 (t d, 1, H<sub>4</sub>), 2.89 (ddd, 1, H<sub>3</sub>), 4.02 - 4.13 (m, 2, OCH<sub>2</sub>), 7.40 (s, 2, NH<sub>2</sub>), 7.54 (q, 1, H<sub>1</sub>), 8.15 (s, 1) and 8.23 (s, 1, H<sub>2</sub> and H<sub>8</sub> of adenine); *anti* isomer 12 (B = adenine-N<sup>9</sup>-yl, R = ethyl) 1.19 (t, 3, CH<sub>3</sub>), 2.07 (ddd, 1) and 2.17 (t d, 1, H<sub>4</sub>), 2.64 (ddd, 1, H<sub>3</sub>), 4.02 - 4.13 (m, 2, OCH<sub>2</sub>), 7.39 (s, 2, NH<sub>2</sub>), 7.59 (q, 1H, H<sub>1</sub>), 8.18 (s, 1, H<sub>2</sub> of adenine), 8.52 (s, 1, H<sub>8</sub> of adenine).

15 <sup>13</sup>C NMR (CD<sub>3</sub>SOCD<sub>3</sub>) ppm, *syn* isomer 11 (B = adenine-N<sup>9</sup>-yl, R = ethyl) 10.70 (C<sub>4</sub>), 14.52 (CH<sub>3</sub>), 19.78 (C-3'), 61.10 (OCH<sub>2</sub>), 111.71 (C<sub>1</sub>), 112.85 (C<sub>2</sub>), 170.71 (C=O); adenine ring: 118.90 (C<sub>5</sub>), 137.75 (C<sub>8</sub>), 148.76 (C<sub>4</sub>), 153.64 (C<sub>2</sub>), 156.56 (C<sub>6</sub>); *anti* isomer 12 (B = adenine-N<sup>9</sup>-yl, R = ethyl) 13.30 (C<sub>4</sub>), 14.52 (CH<sub>3</sub>), 17.52 (C<sub>3</sub>), 61.10 (OCH<sub>2</sub>), 112.18 (C<sub>1</sub>), 113.16 (C<sub>2</sub>), 171.29 (C=O); adenine ring: 118.90 (C<sub>5</sub>), 137.99 (C<sub>8</sub>), 148.76 (C<sub>4</sub>), 153.64 (C<sub>2</sub>), 156.56 (C<sub>6</sub>).

20 EI-MS 259 (M, 54.2), 245 (6.1), 230 (24.3), 214 (28.4), 202 (M, 9.9), 187 (100.0), 160 (19.6), 135 (22.4).

Calculated for C<sub>12</sub>H<sub>13</sub>N<sub>5</sub>O<sub>2</sub>: C, 55.58; H, 5.06; N, 27.02%. Found: C, 55.60; H, 4.82; N, 27.28%.

25 **EXAMPLE 4 - Direct Synthesis of *syn*-N<sup>9</sup>-(2-Carbethoxycyclopropylidenemethyl)adenine (11, B = adenin-N<sup>9</sup>-yl, R = ethyl) and *anti*-N<sup>9</sup>-(2-Carbethoxycyclopropylidenemethyl)adenine (12, B = adenin-N<sup>9</sup>-yl, R = ethyl) from Adenine.**

A mixture of adenine (810 mg, 6.0 mmol), *cis*- and *trans* ethyl 2-bromo-2-bromomethylcyclopropane-1-carboxylates (6 and 7, 2.14 g, 7.5 mmol) from Example 30 1 and flame-dried potassium carbonate (4.98 g, 36.0 mmol) in N,N-dimethylformamide (30 mL) was stirred at 100 °C under nitrogen for 22 hours. After cooling, the insoluble portion was filtered off and it was washed with a mixture of dichloromethane - ethanol (4 : 1, 2 x 50 mL). The filtrate was evaporated and the residue was flash-chromatographed on a silica gel column with dichloromethane - methanol (95 : 5) as 35 an eluent. Evaporation of appropriate fractions gave a mixture of products 11 and 12

(B = adenin-N<sup>9</sup>-yl, R = ethyl) as a pale yellow solid (610 mg, 39.2% yield), mp. 166 - 175°C in the ratio of 2 : 1 as determined by <sup>1</sup>H NMR.

**EXAMPLE 5 - Synthesis of Synadenol (1, B = adenin-N<sup>9</sup>-yl) and anti-N<sup>9</sup>-(2-Hydroxymethylcyclopropylidenemethyl)adenine (2, B = adenin-N<sup>9</sup>-yl).**

Diisobutylaluminum hydride in tetrahydrofuran (1 M, 27.2 mL, 27.2 mmol) was added dropwise into a solution of esters 11 and 12 (B = adenin-N<sup>9</sup>-yl, R = ethyl, 881 mg, 3.4 mmol) from Example 3 or 4 in tetrahydrofuran (50 mL) at 0°C over 10 minutes with stirring under nitrogen. The stirring at 0°C was continued for 3.5 hours. Saturated aqueous ammonium chloride (25 mL) was then added with stirring at 0°C. The gel-like solid was filtered off using a Celite bed and it was washed with dichloromethane - methanol (1 : 1, 5 x 40 mL). The combined filtrate and washings were evaporated and the residue was chromatographed on a silica gel column using dichloromethane - methanol (9 : 1 and 85 : 15) as eluents. The appropriate fractions were evaporated to give a mixture of compounds 1 and 2 (B = adenin-N<sup>9</sup>-yl) as a pale yellow solid (557 mg, 75% yield).

A solution of this mixture of products (557 mg, 2.56 mmol) in N,N-dimethylformamide (30 mL) and N,N-dimethylformamide dimethyl acetal (0.51 mL, 3.85 mmol) was stirred at room temperature for 14 hours. Evaporation of the volatile components *in vacuo* at room temperature (oil pump) left a mixture of compound 1 and 2 (B = N<sup>6</sup>-dimethylaminomethyleneadenin-N<sup>9</sup>-yl) as a viscous yellow sirup which was flash-chromatographed on a silica gel column using dichloromethane - methanol (92 : 8 and 85 : 15). The appropriate fractions were pooled and evaporated to give *syn* isomer 1 (B = N<sup>6</sup>-dimethylaminomethyleneadenin-N<sup>9</sup>-yl), 264 mg, 37.8% yield) as a white solid and *anti* isomer 2 (B = N<sup>6</sup>-dimethylaminomethyleneadenin-N<sup>9</sup>-yl, 260 mg, 37.2% yield) as a foam. A small portion of 1 and 2 (B = N<sup>6</sup>-dimethylaminomethyleneadenin-N<sup>9</sup>-yl, 63 mg, 9.0% yield) was recovered as a mixture. *Syn* isomer 1 (B = N<sup>6</sup>-dimethylaminomethyleneadenin-N<sup>9</sup>-yl):

Mp. 172 - 178°C.

UV (ethanol) max 311nm ( $\epsilon$  31,300), 233 nm ( $\epsilon$  27,600).

IR (KBr) 3500 - 3180 cm<sup>-1</sup> (OH), 1638 and 1600 - 1540 cm<sup>-1</sup> (olefin and N<sup>6</sup>-dimethylaminomethyleneadenine), 1060, 1030, 830 and 810 cm<sup>-1</sup> (cyclopropane ring).

<sup>1</sup>H NMR (CD<sub>3</sub>SOCD<sub>3</sub>)  $\delta$  1.21 (t, 1) and 1.49 (t, 1, H<sub>4</sub>), 2.14 (dq, 1, H<sub>3</sub>), 3.17 and 3.10 (s, 6, N(CH<sub>3</sub>)<sub>2</sub>), 3.29 (t, overlapped with H<sub>2</sub>O, 1) and 3.74 (dt, 1, H<sub>5</sub>), 5.11

HRMS Calculated for C<sub>12</sub>H<sub>12</sub><sup>35</sup>ClN<sub>5</sub>O<sub>2</sub>: M 293.06795. Found: M 293.0680.

25 Calculated for C<sub>12</sub>H<sub>12</sub>ClN<sub>5</sub>O<sub>2</sub>: C, 49.14; H, 4.13; Cl, 11.93; N, 23.89. Found: C, 49.00; H, 4.27; Cl, 12.11; N, 24.18.

**EXAMPLE 7 - Synthesis of *syn*-2-Amino-6-chloro-N<sup>9</sup>-(2-carbethoxycyclopropylidenemethyl)purine (1, B = 2-amino-6-chloropurin-N<sup>9</sup>-yl) and *anti*-2-Amino-6-chloro-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)purine (1, B = 2-amino-6-chloropurin-N<sup>9</sup>-yl).**

Diisobutylaluminum hydride in cyclohexane (1 M, 19.4 mL, 19.4 mmol) was added dropwise into a solution of esters 11 and 12 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl, R = ethyl, 1.90 g, 6.47 mmol) from Example 6 in tetrahydrofuran (100 mL) during 10 min. with stirring at 0°C under nitrogen. Two additional portions of hydride (6.47 mL, 6.47 mmol) were added in 30 min. intervals. The stirring at 0°C was continued for a

total of 2 hours. The reaction was carefully quenched by adding aqueous methanol (50%, 10 mL) with stirring which was continued for 30 min. at 0°C and then overnight at room temperature. The precipitated gel was filtered off and it was washed thoroughly with dichloromethane - methanol (4 : 1, 2 × 50 mL). The combined filtrate and washings were evaporated and the residue was chromatographed on a silica gel column using dichloromethane - methanol (97 : 3 and 92 : 8). The fractions of separated products 1 and 2 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl) were rechromatographed to give *syn* isomer 1 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl, 680 mg, 41.8% yield) and *anti* isomer 2 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl, 380 mg, 23.3% yield). Analytical samples of both isomers were obtained by recrystallization from ethanol.

Syn isomer 1 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl):

EI-MS 221 (M, 16.5), 206 (9.8), 190 (9.8), 162 (100.0), 135 (8.9), 119 (23.1), 111 (15.4).

EXAMPLE 12 - **S y n t h e s i s o f s y n -  $\text{N}^1$  - ( 2 - Hydroxymethylcyclopropylidenemethyl)cytosine (1, B = cytosin- $\text{N}^1$ -yl) and *anti*- $\text{N}^1$ -(2-Hydroxymethylcyclopropylidenemethyl)cytosine (2, B = cytosin- $\text{N}^1$ -yl).**

A solution of diisobutylaluminum hydride in cyclohexane (1 M, 35.2 mL, 35.2 mmol) was added dropwise into stirred suspension of 1 : 2 mixture of esters 11 and 12 (B = cytosin- $\text{N}^1$ -yl, R = methyl, 1.73 g, 7.82 mmol) from Example 11 in tetrahydrofuran (230 mL) within 15 min at  $0^\circ\text{C}$  under nitrogen. After 4 hours, another portion of diisobutylaluminum hydride (11.7 mL, 11.7 mmol) was added. The stirring was continued at  $0^\circ\text{C}$  for another 2 hours. The reaction was quenched by adding methanol - water (2:1, 30 mL) dropwise at  $0^\circ\text{C}$ . The mixture was then stirred overnight at room temperature. The gel-like solid was filtered off and it was washed with dichloromethane - methanol (1 : 1,  $5 \times 60$  mL) with the aid of a sonicator. The combined filtrate and washings were evaporated to give a mixture of crude products 1 and 2 (B = cytosin- $\text{N}^1$ -yl, 1.56 g) as a pale yellow solid.

This mixture (7.82 mmol) was dissolved in refluxing ethanol (200 mL). Benzoic anhydride (1.77 g, 7.82 mmol) was added with stirring into a hot solution and the refluxing was continued for 1 h. Five more portions of benzoic anhydride (1.77 g, 7.82 mmol each) were added every hour. After cooling, the solvent was evaporated to give a pale yellow solid which was partitioned between dichloromethane (150 mL) and saturated aqueous sodium hydrogen carbonate (150 mL). The aqueous phase was extracted with dichloromethane ( $3 \times 50$  mL). The combined organic phases were washed with a mixture of saturated aqueous sodium hydrogen carbonate - saturated aqueous sodium chloride (1: 3, 40 mL) and they were dried over sodium sulfate. Removal of the solvents left a pale yellow solid which was chromatographed on a silica gel column using dichloromethane - methanol (98 : 2 and 95 : 5) to give O,N-dibenzoylated compounds (*syn/anti* mixture, 625 mg, 20% yield),  $\text{N}^4$ -benzoylated *syn* isomer (1, B =  $\text{N}^4$ -benzoylcytosin- $\text{N}^1$ -yl, 480 mg, 20.7% yield), and  $\text{N}^4$ -benzoylated

*anti* isomer (2, B = N<sup>4</sup>-benzoylcytosin-N<sup>1</sup>-yl, 960 mg, 41.4% yield). Both isomers were recrystallized from ethanol.

**EXAMPLE 14 - Synthesis of Methyl Phenylphosphoro-L-alaninate of *anti*-N<sup>9</sup>-(2-Hydroxymethylcyclopropylidenemethyl)adenine (4, B = adenin-N<sup>9</sup>-yl).**

The procedure described in Example 13 was used on the same scale starting from *anti*-N<sup>9</sup>-(2-hydroxymethylcyclopropylidenemethyl)adenine (2, B = adenin-N<sup>9</sup>-yl). The reaction mixture was stirred at room temperature for 4 h. After removal of solvents, the residue was dissolved in methanol (1 mL) and it was partitioned between ethyl acetate (250 mL) and water (100 mL). The aqueous phase was extracted once with ethyl acetate (60 mL). The combined organic phases were washed with water (4 × 80 mL) and brine (80 mL). They were dried over  $\text{Na}_2\text{SO}_4$  and evaporated to leave a syrup. Chromatography on a silica gel column using gradient dichloromethane - methanol (95 : 5 → 92 : 8) gave compound 4 (B = adenin-N<sup>9</sup>-yl) as a white foam (328 mg, 74% yield).

**EXAMPLE 15 - Synthesis of Methyl Phenylphosphoro-L-alaninate of *syn*-2,6-diamino- $N^9$ -(2-Hydroxycyclopropylidene-methyl)purine (3, B = 2,6-diaminopurin- $N^9$ -yl).**

Phenylmethoxyalaninyl phosphorochloridate (13) in tetrahydrofuran (0.184 M, 16.7 mL, 3 mmol) was added dropwise into a suspension of *syn*-2,6-diamino-(2-hydroxymethylcyclopropylidenemethyl)purine (1, B = 2,6-diaminopurin- $N^9$ -yl, 140 mg, 0.6 mmol) in pyridine (20 mL) with stirring at room temperature. After 5 min., N-methylimidazole (0.48 mL, 6 mmol) was added and the stirring was continued for 3 h. An insoluble gum which formed was dissolved by addition of pyridine (20 mL) and the reaction mixture was stirred overnight at room temperature. The solvents were evaporated, the residue was dissolved in 80% acetic acid (35 mL) and the solution was allowed to stand at room temperature for 88 h and then it was evaporated. Chromatography of the crude product on a silica gel column using dichloromethane-methanol (95:5) gave a yellow sirup. This product was dissolved in a mixture of methanol (20 mL) and 0.1 M  $Na_2HPO_4$  (pH 7.5, 20 mL). The solution was stirred overnight at room temperature, it was then evaporated and the product was rechromatographed as shown above. The obtained hygroscopic gum was dissolved in methanol (1 mL), water (10 mL) was added and the resultant suspension was lyophilized to give compound 3 (B = 2,6-diaminopurin- $N^9$ -yl, 170 mg, 60%) as a white solid.

#### EXAMPLE 16 - *In Vitro* Antiviral Evaluation Methods

*Cells and viruses.* The routine growth and passage of KB cells was performed in monolayer cultures using minimal essential medium (MEM) with either Hanks salts [MEM(H)] or Earle salts [MEM(E)] supplemented with 10% calf serum. The sodium bicarbonate concentration was varied to meet the buffering capacity required. Cultures of diploid human foreskin fibroblasts (HFF) or MRC-5 cells were grown in medium consisting of MEM(E) with 10% fetal bovine serum. Cells were passaged at 1 : 2 to 1 : 10 dilutions according to conventional procedures by using 0.05% trypsin plus 0.02% EDTA in a HEPES buffered salt solution (HBS) (Shipman, C., Jr., *Proc. Soc. Exp. Biol.* 130:305-310 (1969)) as described previously. Turk, S.R., et al., *Antimicrob. Agents Chemother.* 31:544-550 (1987). HFF and MRC-5 cells were passaged only at 1 : 2 dilutions. CEM cells were maintained in suspension culture as detailed previously. Kucera, L.S., et al., *AIDS Res. Human Retroviruses* 9:307-314 (1993).

*Virological procedures.* Stock HCMV was prepared by infecting HFF cells at a multiplicity of infection (m.o.i.) of  $<0.01$  plaque-forming units (p.f.u.) per cell. Cell growth medium was changed every four days until cytopathology was evident in all cells (approximately 21 days). Supernatant fluids were retained as the virus stock. High titer HSV-1 stocks were prepared by infecting KB cells at an m.o.i. of  $<0.1$  as detailed previously. Turk, S.R., et al., *Antimicrob. Agents Chemother.* 31:544-550 (1987). Virus titers were determined using monolayer cultures of HFF cells for HCMV and monolayer cultures of BSC-1 cells for HSV-1 as described earlier. Prichard, M.N., et al., *J. Virol. Methods* 28:101-106 (1990). Briefly, HFF or BSC-1 cells were planted as described above in 96-well cluster dishes and incubated overnight at  $37^\circ\text{C}$

in a humidified 3% CO<sub>2</sub> - 97% air atmosphere. The next day cultures were inoculated with HCMV or HSV-1 and serially diluted 1 : 3 across the remaining eleven columns of the 96-well plate. Cultures were incubated at 37°C for 2 hr to permit virus adsorption and then virus inoculum was replaced with 0.2 mL of fresh medium.

- 5 Cultures were incubated for seven days for HCMV, two or three days for HSV-1, medium was removed, and the cell sheets were stained with 0.1% crystal violet in 20% methanol. Plaques were enumerated under 20-fold magnification in wells having the dilution which gave 5 to 20 plaques per well. Virus titers were calculated according to the following Formula: Titer (p.f.u./mL) = number of plaques x 5 x 3<sup>n</sup>;
- 10 where n represents the nth dilution of the virus used to infect the well in which plaques were enumerated.

*Assays for Antiviral Activity.*

- (a) HCMV. The effect of compounds on the replication of HCMV has been measured using a plaque reduction assay. HFF cells in 24-well cluster dishes were
- 15 infected with approximately 100 p.f.u. of HCMV per cm<sup>2</sup> cell sheet using the procedures detailed above. Following virus adsorption, compounds dissolved in growth medium were added to duplicate wells in three to six selected concentrations. Following incubation at 37°C for 7 to 10 days, cell sheets were fixed, stained with crystal violet and microscopic plaques enumerated as described above. Drug effects
- 20 were calculated as a percentage of reduction in number of plaques in the presence of each drug concentration compared to the number observed in the absence of drug. Ganciclovir (DHPG) was used as a positive control in all experiments.

- The effect of compounds on the replication of HCMV also was measured using a yield reduction assay. HFF cells were planted as described above in 96-well cluster
- 25 dishes, incubated overnight, medium removed and the cultures were inoculated with HCMV at a m.o.i. of 0.5 to 1 p.f.u. per cell as reported elsewhere. After virus adsorption, inoculum was replaced with 0.2 mL of fresh medium containing test compounds. The first row of 12 wells was left undisturbed and served as virus controls. Each well in the second row received an additional 0.1 mL of medium with
- 30 test compound at three times the desired final concentration. The contents of the 12 wells were mixed by repeated pipetting and then serially diluted 1 : 3 along the remaining wells. In this manner, six compounds could be tested in duplicate on a single plate with concentrations from 100 μM to 0.14 μM. Plates were incubated at 37°C for seven days, subjected to one cycle of freezing and thawing; aliquots from
- 35 each of the eight wells of a given column were transferred to the first column of a

fresh 96-well monolayer culture of HFF cells. Contents were mixed and serially diluted 1 : 3 across the remaining eleven columns of the secondary plate. Each column of the original primary plate was diluted across a separate plate in this manner. Cultures were incubated, plaques were enumerated, and titers calculated as described above.

5 (b) HSV-1. An enzyme-linked immunosorbent assay (ELISA) was employed to detect HSV-1. 96-well cluster dishes were planted with BSC-1 cells at 10,000 cells per well, in a total volume of 200  $\mu$ L per well of MEM(E) plus 10% calf serum. After overnight incubation at 37°C, drug and HSV-1 was added at the rate of 100 PFU/well. ELISA plates were blocked with 200  $\mu$ L per well of 10% calf serum and 0.05% tween  
10 in HBS. After incubation for 30 minutes, the blocking agent was rinsed two times with HBS-T. A 1 : 400 dilution of AP conjugated rabbit anti-HSV-1 antibody in HBS-F was added. Plates were sealed with adhesive sheet, and incubated on rocker for one hour at 37°C. Plates were developed in the dark with 100  $\mu$ L per well of substrate solution containing p-nitrophenyl phosphate. Plates were read at 492 nm. Drug effects were  
15 calculated as a percentage of the reduction in virus in the presence of each drug concentration compared to the titer obtained in the absence of drug. Acyclovir was used as a positive control in all experiments.

(c) HHV-6. In this case, enzyme-linked immunosorbent assay (ELISA) was performed in covalent amine plates (Costar, Cambridge, MA). The plates were  
20 activated by the addition of a homobifunctional crosslinking agent, bis(sulfosuccinimidyl) suberate, which was dissolved at 1 mg/mL in 30 mL of phosphate buffered saline (PBS: 137 mM NaCl, 2.7 mM KCl, 4.3 mM Na<sub>2</sub>HPO<sub>4</sub>, 1.4 mM KH<sub>2</sub>PO<sub>4</sub>, pH 7.4) and 300  $\mu$ L of the crosslinker was added to each well in the covalent plate. The crosslinker reacted with the amine function on the plate for 30 min  
25 at room temperature. The byproduct, sodium N-hydroxysuccinimide sulfite, was removed by decanting and washing the plate twice with PBS. Samples consisting of 150  $\mu$ L of mixed suspended HSB<sub>2</sub> cells from the original drug-treated plate were solubilized in an equal volume of 10% Triton X-100 in coating buffer (15 mM Na<sub>2</sub>CO<sub>3</sub>, 3.5 mM NaHCO<sub>3</sub>, pH 9.6). The plate was covered and then incubated for 1 h at 37°C  
30 in a 5% CO<sub>2</sub> atmosphere. These binding conditions facilitated covalent attachment of the antigen to the free end of the crosslinker.

After covalent binding, the antigen solution was decanted and the plate was washed six times in HEPES buffered saline (Shipman, C., Jr., *Proc. Soc. Exp. Biol.* 130:305-310 (1969)) with 0.05% Tween 20 (HBS-T ), soaking for three min for each  
35 wash. Unbound sites on the plate were blocked with 300  $\mu$ L per well of 2% lowfat dry

milk in PBS (blocker) for 30 min at room temperature on a shaker. The blocker was decanted and 50  $\mu$ L of the diluted primary monoclonal antibody, specific for HHV-6 (GS) glycoprotein gp116, was added. The antibody solution consisted of antibody diluted 1 : 400 in equal volumes of blocker and 10% Triton X-100 in coating buffer.

- 5 The presence of both blocker and detergent in the antibody solutions was necessary to reduce background signal. The plate was then covered and incubated for 1 h at 37°C. The plate was washed again, as described above, then blocker was added again, as before. Next, each well received 100  $\mu$ L of a solution of the secondary antibody, horse radish peroxidase-labeled rabbit anti-mouse antibody, diluted to 1 :  
10 400 (as above). The plate was incubated for 1 h at 37°C. The plate was washed again as described above, and developed using 100  $\mu$ L/well of TMB-Turbo (Pierce, Rockford, IL) for 30 min at room temperature. The reaction was stopped with 50  $\mu$ L/well 2 M H<sub>2</sub>SO<sub>4</sub>. Absorbance in each well was determined at 450/570 nm.

(d) HIV-1. Reverse transcriptase (RT) was employed as a marker for HIV-1.

- 15 This assay measured the presence of HIV in supernatants of CEM cells infected with strain III<sub>B</sub> of HIV-1 by the amount of RT activity. Cells were grown, infected, and incubated in the presence of seven concentrations (one-half log<sub>10</sub> dilutions) beginning at 1 or 100  $\mu$ M of compounds to be assayed. Procedures and the RT assay were performed as detailed previously. Kucera, L.S., et al., *AIDS Res. Human*  
20 *Retroviruses* 9:307-314 (1993); White, E.L., et al., *Antiviral Res.* 16:257-266 (1991).

- Cytotoxicity assays.* Two different assays were used to explore cytotoxicity of selected compounds as we have detailed previously. (i) Cytotoxicity produced in stationary HFF cells and in growing CEM cells was determined by microscopic inspection of cells used in plaque and RT assays which were not affected by the  
25 virus. Turk, S.R., et al., *Antimicrob. Agents Chemother.* 31:544-550 (1987). (ii) The effect of compounds during two population doublings of KB cells was determined by crystal violet staining and spectrophotometric quantitation of dye eluted from stained cells. Prichard, M.N., et al., *Antimicrob. Agents Chemother.* 35:1060-1065 (1991).

- Data Analysis.* Dose-response relationships were constructed by linearly  
30 regressing the percent inhibition of parameters derived in the preceding sections against log drug concentrations. Fifty-percent inhibitory (IC<sub>50</sub>) concentrations were calculated from the regression lines. Samples containing positive controls (acyclovir for HSV-1, ganciclovir for HCMV, and 2-acetylpyridine thiosemicarbazone for cytotoxicity) were used in all assays.

**Testing Results.** Compounds of Formula 1 exhibit a significant activity against herpes viruses. It was found that compounds of the present invention strongly inhibit the replication of HCMV as measured by plaque and yield reduction assays using HFF as host cells by the method described above and they also inhibit the replication of HSV-1 as determined by enzyme-linked immunosorbent assay (ELISA).

## 25 EXAMPLE 17 - *In vivo* Antiviral Evaluation Method

Compounds 1 (B = adenin-N<sup>9</sup>-yl and guanin-N<sup>9</sup>-yl) were evaluated in mice infected with murine cytomegalovirus (MCMV). Mice were infected intraperitoneally with sufficient MCMV to produce 90 to 100% mortality. Compounds were administered once daily for five days at doses of 5.6, 16.7 and 50 mg/kg by intraperitoneal injection in a 0.4% suspension of carboxymethylcellulose. Ganciclovir was administered in sterile water at the same doses as a positive control drug. All

compounds were administered to separate groups of 15 mice each at 6, 24, and 48 hours after infection with MCMV. Groups of 10 uninfected mice also received test compounds as toxicity controls at the doses listed above.

Compound 1 (B = adenin-N<sup>9</sup>-yl) reduced mortality from 100% in placebo treated mice to 33% in mice treated with 50 mg/kg of the drug. Decreasing effects were noted at lower doses and when drug administration was delayed until 24 or 48 hours after infection. No deaths were observed in uninfected mice that received only drug.

In a second experiment, compound 1 (B = guanin-N<sup>9</sup>-yl) reduced mortality from 90% in placebo treated mice to about 7 to about 13% in mice treated with 16.7 or 50 mg/kg of this drug. No deaths were observed in uninfected mice that received only drug. In a similar manner, ganciclovir reduced mortality to about 0 to about 20% at these doses and it was somewhat more effective than compound 1 (B=guanin-N<sup>9</sup>-yl) at 5.6 mg/kg.

**EXAMPLE 18 -      Synthesis of *syn*-2-Amino-6-methoxy-N<sup>9</sup>-(2-hydroxymethyl-cyclopropylidene)methyl)purine (1, B = 2-amino-6-methoxypurin-N<sup>9</sup>-yl).**

A solution of compound 1 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl, 50 mg, 0.17 mmol) from Example 7 and K<sub>2</sub>CO<sub>3</sub> (84 mg, 0.61 mmol) in methanol - water (9 : 1, 5 mL) was stirred at room temperature for 60 h. Volatile components were removed by evaporation. The residue was chromatographed on silica gel using dichloromethane - methanol (95 : 5 → 9 : 1) to give product 1 (B = 2-amino-6-methoxypurin-N<sup>9</sup>-yl) as a white solid (40 mg, 95 %).

Mp. 196-199°C.

UV (ethanol) max 280 nm ( $\epsilon$  11,600), 224 nm ( $\epsilon$  31,000).

IR (KBr) 3400, 3310, 3210, and 3100 cm<sup>-1</sup> (NH<sub>2</sub> and OH), 1645 and 1585 cm<sup>-1</sup> (olefin and purine ring), 1050 cm<sup>-1</sup> (cyclopropane).

<sup>1</sup>H NMR (CD<sub>3</sub>SOCD<sub>3</sub>)  $\delta$  1.16 (ddd, 1) and 1.44 (td, 1, H<sub>4</sub>), 2.07 (dqd, 1, H<sub>3</sub>), 3.33 (ddd, overlapped with H<sub>2</sub>O at 3.30, 1) and 3.69 (dt, 1, H<sub>5</sub>), 3.41 (s, 3H, OCH<sub>3</sub>), 5.08 (dd, 1, OH), 6.52 (s, 2, NH<sub>2</sub>), 7.19 (d, 1, H<sub>1</sub>), 8.47 (s, 1, H<sub>8</sub> of purine).

<sup>13</sup>C NMR (CD<sub>3</sub>SOCD<sub>3</sub>) ppm 6.59 (C<sub>4</sub>), 19.57 (C<sub>3</sub>), 63.68 (C<sub>5</sub>), 63.33 (OCH<sub>3</sub>), 110.54 (C<sub>1</sub>), 115.09 (C<sub>2</sub>), 113.87 (C<sub>5</sub>), 136.94 (C<sub>8</sub>), 152.94 (C<sub>4</sub>), 160.55 (C<sub>2</sub>) and 161.13 (C<sub>6</sub>).

5 **EXAMPLE 19 - Synthesis of *syn*-2-Amino-6-azido- $N^9$ -(2-hydroxymethylcyclopropylidene-methyl)purine (1, B = 2-amino-6-azidopurin- $N^9$ -yl).**

A mixture of compound 1 (B = 2-amino-6-chloropurin- $N^9$ -yl, 151 mg, 0.6 mmol) from Example 7 and sodium azide (117 mg, 1.8 mmol) in N,N-dimethylformamide (10 mL) was heated in an oil bath at 107°C for 4 h. After evaporation of the solvent in vacuo, water (5 ml) was added to the residue to give product 1 (B = 2-amino-6-azidopurin- $N^9$ -yl) as a white solid (137 mg, 88.4 %).

Mp. 184-187°C (dec.).

UV (ethanol) max 302 nm ( $\epsilon$  11,450), 281 nm (shoulder,  $\epsilon$  9,830), 229 nm ( $\epsilon$  30,330).

15 IR (KBr): 3440, 3310 and 3140  $cm^{-1}$  ( $NH_2$  and OH), 1640-1680 and 1565  $cm^{-1}$  (olefin and purine ring), 1040 and 1020  $cm^{-1}$  (cyclopropane ring).

$^1H$  NMR ( $CD_3SOCD_3$ )  $\delta$  1.24 (ddd, 1) and 1.51 (td, 1,  $H_4$ ), 2.15 (m, 1H,  $H_3$ ), 3.28-3.38 (m, partially overlapped with  $H_2O$  at 3.34, 1) and 3.72 (dt, 1,  $H_5$ ), 5.08 (t, 1, OH), 7.32 (d, 1,  $H_1$ ), 8.47 (s, 2H, 2- $NH_2$ ), 8.74 (s, 1,  $H_8$ ).

20  $^{13}C$  NMR ( $CD_3SOCD_3$ ) ppm 6.76 ( $C_4$ ), 19.72 ( $C_3$ ), 63.13 ( $C_5$ ), 110.61 ( $C_{1'}$ ), 111.99 ( $C_2$ ), 117.45 ( $C_5$ ), 137.41 ( $C_8$ ), 143.63 ( $C_4$ ), 144.42 ( $C_2$ ), and 146.48 ( $C_6$ ).

Calculated for  $C_{10}H_{10}N_8O \cdot H_2O$ : C, 43.48; H, 4.38; N, 40.56. Found: C, 43.45; H, 4.23; N, 40.48.

**EXAMPLE 20 - Synthesis of Ethyl-(*R*)-Methylenecyclopropanecarboxylate.**

25 (*R*)- and (*S*)-Methylenecyclopropanecarboxylic acids were prepared as described. Lai, M.-T., Liu, L.-D., Liu, H.-W. *J. Am. Chem. Soc.* 113: 7388-7397 (1991).

The (*R*)-methylenecyclopropanecarboxylic acid (3.92 g, 39.95 mmol) was stirred in ethanolic HCl (1.0 M, 60 mL) at room temperature for 24 h. The solution was diluted with water (60 mL) and then extracted with 1-pentane (8 x 80 mL). The combined extracts were washed with water, saturated  $NaHCO_3$ , water and brine (80 mL each). After drying ( $Na_2SO_4$ ) the solvents were removed by distillation and the crude product was used directly in the next step.

30 The *S*-enantiomer was prepared by the same procedure starting from (*S*)-methylenecyclopropanecarboxylic acid.

**EXAMPLE 21-      Synthesis of Ethyl-(2*R*)-2-Bromo-2-bromomethyl-(1*S*)-cyclopropane-carboxylate and Ethyl-(2*S*)-2-Bromo-2-bromomethyl-(1*S*)-cyclopropanecarboxylate.**

Bromine (2.25 mL, 43.67 mmol) was added into a solution of ethyl-  
5 (R)-methylenecyclopropanecarboxylate from Example 20 in CCl<sub>4</sub> (80 mL) during 15 min at 0°C with stirring. After 0.5 h the volatile components were evaporated in vacuo and the excess of bromine was removed with Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. A yellowish oil (11.02 g, 96.5% crude yield) thus obtained was pure enough for the next step as shown by <sup>1</sup>H NMR, which was similar to racemic cis and trans isomers 6 and 7 (Example 1).  
10 The HPLC (detection at 220 nm) on Chiralpak AD column in hexane - 2-propanol (9 : 1, 1 mL/min) indicated the presence of two diastereoisomers, t<sub>R</sub> (min) 4.34 (1*S*, 2*S*) and 5.65 (1*S*, 2*R*).

The 1*R*, 2*S* and 1*R*, 2*R*-diastereoisomers were prepared in a similar fashion, t<sub>R</sub> 4.47 (1*R*, 2*S*) and 6.02 (1*R*, 2*R*).

15 **EXAMPLE 22 -      Synthesis of *R*-(-)- and *S*-(+)-enantiomers of compounds 1 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl, B = guanin-N<sup>9</sup>-yl or 2,6-diamino-purin-N<sup>9</sup>-yl or 2-amino-6-cyclopropyl-aminopurin-N<sup>9</sup>-yl or 2-amino-6-methoxypurin-N<sup>9</sup>-yl) and compound 2 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl).**

20 The reduction of diastereoisomeric esters described in Example 21 followed the procedure for the corresponding racemates of cis and trans isomers. Qiu, Y.-L., Zemlicka, J. *Synthesis* 1447-1452 (1998). Subsequent acetylation and alkylation of 2-amino-6-chloropurine 8 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl) with the resultant 1*R* or 1*S* cis and trans 1-acetoxymethyl-2-bromo-2-bromomethylcyclopropanes was also  
25 performed as described for the racemic compounds to give, after deacetylation, the title *R*- or *S*-enantiomers. All HPLC determinations of purity and enantiomeric excess were carried out under isocratic conditions on a Chiralpak AD column with methanol as the solvent and a flow rate of 1 mL/min.

***R*-(-)-enantiomer of compound 1 (B = 2-amino-6-chloropurin-N<sup>9</sup>-yl).**

30 HPLC: t<sub>R</sub> = 27.23 min, purity 100%, 98.9% ee.

25 **EXAMPLE 23 - Synthesis of (*R*)-(-)-Synadenol 1 (B = adenin- $N^9$ -yl) and (*S*)-(+)-Synhypoxanthol (1, B = hypoxanthin- $N^9$ -yl).**

A suspension of racemic synadenol (1, B = adenin- $N^9$ -yl, 200 mg, 0.92 mmol) from Example 5 in 0.05 M  $Na_2HPO_4$  (pH 7.5, 100 mL) was briefly sonicated. Adenosine deaminase from calf intestine (Type II, Sigma Chemical Co., St. Louis, MO, 30 mg, 45 units) was added and the mixture was stirred at room temperature.

30 The progress of the reaction was followed by TLC in dichloromethane - methanol (9 : 1). The deamination stopped after 72 h and the ratio of synadenol (1, B = adenin- $N^9$ -yl) : synhypoxanthol (1, B = hypoxanthin- $N^9$ -yl) was 7 : 3 as determined by UV spectrophotometry of the eluted spots. Addition of another two portions of enzyme (30 mg every 24 h) did not improve this ratio. The mixture was lyophilized and the

35 resultant product was sonicated with several portions of dichloromethane - methanol

(1 : 1, first 100 mL and then 40 mL) until no UV absorption was detectable in the solvent. The filtrate and washings were combined and evaporated. The residue was adsorbed on silica gel (4 g) and loaded on a column made of the same material. Chromatography using dichloromethane - methanol (9 : 1) as an eluent afforded  
5 (R)-(-)-synadenol (1, B = adenin-N<sup>9</sup>-yl), 135 mg, 66.5 %),  $[\alpha]^{25}_D$  -59.1° (c 0.04, MeOH) and elution with dichloromethane - methanol (4 : 1) gave (S)-(+)-synhypoxanthol (1, B = hypoxanthin-N<sup>9</sup>-yl), 85 mg,  $[\alpha]^{25}_D$  91.8° (c 0.1, MeOH).

The obtained (R)-(-)-synadenol (1, B = adenin-N<sup>9</sup>-yl, 135 mg, 0.62 mmol) was subjected to a second round of deamination (60 mg, 90 units of enzyme) under the  
10 conditions described above. TLC showed a ratio of synadenol (1, B = adenin-N<sup>9</sup>-yl) : synhypoxanthol (1, B = hypoxanthin-N<sup>9</sup>-yl) as 7 : 3 after 40 h. Prolonged reaction time did not improve the conversion. Work-up followed by chromatography as described above gave optically enriched (R)-(-)-synadenol (1, B = adenin-N<sup>9</sup>-yl), 95 mg, 47.5 %,  $[\alpha]^{25}_D$  -112.0° (c 0.095, MeOH) and (S)-(+)-synhypoxanthol (1, B =  
15 hypoxanthin-N<sup>9</sup>-yl), 40 mg,  $[\alpha]^{25}_D$  89.0° (c 0.1, MeOH). The combined portions of the latter product (125 mg) were rechromatographed on silica gel using dichloromethane - methanol (4 : 1) to afford optically pure (S)-(+)-synhypoxanthol (1, B = hypoxanthin-N<sup>9</sup>-yl), 96 mg, 47.8 %, as a white solid.

Mp. 235-240°C.

20  $[\alpha]^{25}_D$  112.5° (c 0.08, MeOH).

UV (ethanol) max 228 nm ( $\epsilon$  31,300).

IR (KBr): 3450 cm<sup>-1</sup> (OH), 1600 and 1670-1690 cm<sup>-1</sup> (purine ring and olefin), 1040 cm<sup>-1</sup> (cyclopropane ring).

<sup>1</sup>H NMR (CD<sub>3</sub>SOCD<sub>3</sub>)  $\delta$  1.21 (ddd, 1) and 1.48 (td, 1, H<sub>4</sub>), 2.12 (dqd, 1, H<sub>3</sub>),  
25 3.28 (dt, overlapped with H<sub>2</sub>O, 1) and 3.72 (dd, 1, H<sub>5</sub>), 5.09 (t, 1, OH), 7.33 (d, 1, H<sub>1</sub>), 8.07 (s, 1, H<sub>2</sub>), 8.69 (s, 1, H<sub>8</sub>), 12.41 (s, 1, NH).

<sup>13</sup>C NMR (CD<sub>3</sub>SOCD<sub>3</sub>) ppm: 6.67 (C<sub>4</sub>), 19.62 (C<sub>3</sub>), 63.11 (C<sub>5</sub>), 110.50 (C<sub>1</sub>), 117.58 (C<sub>2</sub>), 124.18 (C<sub>5</sub>), 137.56 (C<sub>8</sub>), 146.61 (C<sub>2</sub>), 147.19 (C<sub>4</sub>), 156.97 (C<sub>6</sub>).

In another experiment, racemic synadenol (1, B = adenin-N<sup>9</sup>-yl), 450 mg, 2.07 mmol furnished optically enriched (R)-(-)-enantiomer 1 (B = adenin-N<sup>9</sup>-yl, 200 mg,

44.4 % ) and (S)-(+)-synhypoxanthol (1, B = hypoxanthin-N<sup>9</sup>-yl), 200 mg, 44.4 %. The combined portions of optically enriched (R)-(-)-synadenol (1, B = adenin-N<sup>9</sup>-yl), 280 mg, 1.29 mmol) from both experiments were incubated with adenosine deaminase (100 mg, 150 units) in phosphate buffer (250 mL) as described above. The ratios of  
5 synadenol (1, B = adenin-N<sup>9</sup>-yl) : synhypoxanthol (1, B = hypoxanthin-N<sup>9</sup>-yl) were 94 : 6 after 24 h and 93 : 7 after 48 h. Work-up and purification as described above gave optically pure (R)-(-)-synadenol (1, B = adenin-N<sup>9</sup>-yl), 250 mg, 38.5 % overall yield based on racemic synadenol (1, B = adenin-N<sup>9</sup>-yl), 650 mg, 2.99 mmol.

HPLC (see Example 22):  $t_R$  10.99 min., 96 % ee.

10 Mp. 237-238°C.

**EXAMPLE 26: *In vitro* Antiviral Activity.**

20 *In vitro* antiviral activity was determined using the methods described in Example 16. The *R*- and *S*-enantiomers of the compounds of Formula 1 were synthesized and their antiviral activity against HCMV, HSV-1 and HSV-2 *in vitro* was investigated. The enantioselectivity of the antiviral effect depends on the type of the heterocyclic base and virus involved. Both enantiomers of adenine analogue (B =  
25 adenine) were equipotent against HCMV (EC<sub>50</sub> 2.4 and 2.9  $\mu$ M, respectively) whereas the *S*-enantiomers of the rest of the group were strongly preferred (EC<sub>50</sub> 1.8 - 21  $\mu$ M) over *R*-enantiomers (30 - >100  $\mu$ M) (the *S*-enantiomers were the most effective agents in the HSV-1 assay of active analogues).

Two racemic analogues of Formula 1, B = 2-amino-6-methoxypurine and B =  
30 2-amino-6-azidopurine were assayed for antiviral activity. Both showed good activity against HCMV, while only the B = 2-amino-6-methoxypurine showed any significant activity against HSV-1.

**Antiviral activity:**

Those skilled in the art can now appreciate from the foregoing description that the broad teachings of the present invention can be implemented in a variety of forms. Therefore, while this invention has been described in connection with particular examples thereof, the true scope of the invention should not be so limited since other modifications will become apparent to the skilled practitioner upon a study of the drawings and specification.

All patents and other publications cited herein are expressly incorporated by reference.
